- 3. Will freeze up and cause damage to the furnace controls.*
- 4. Causes electric bills to be as much as 50% higher.*
- 5. Will not remove humidity from the home.*

The light way to pinpoint leaks.

Ultra-Violet Leak Detection is a state of the art system—fast, easy, accurate, safe, reliable, and cost-effective.

Add fluorescent dye into an operating AC system. It combines and circulates with the refrigerant. Wherever the refrigerant escapes at leak sites, the dye remains. When scanned by a powerful ultraviolet inspection lamp, the dye shows all leaks with a bright yellow-green glow.

Ultra-violet leak detection has been proven to reveal leaks smaller than 1/8 ounce per year. These dyes are currently being used in **over 20 million** systems worldwide.

How Does This Work?

- 1. Florescent Dye is added to the system.**
- 2. System is then fully charged with refrigerant.**
- 3. The system must then be operated.**
- 4. Locate leak with ultra-violet light.**
- 5. Leaks will be repaired if they are accessible.**
- 6. Refrigerant is re-installed & fully recharged**
